Feature contributions

Relative feature contribution magnitude

Human-readable explanation

The model produced risk category LOW, trust score 81.76, and confidence score 1.0. The principal model factors increasing modeled risk were: High recent transaction velocity. The principal model factors reducing modeled risk were: Established device relationship, Established payment corridor, Established customer relationship. This explanation describes model evidence only and does not constitute an institutional transaction decision.

5. Policy interpretation

Advisory recommendation: APPROVE
Policy is reported separately from AI inference.

6. Reconstructable evidence chain

Feature & Context → AI Trust → Explainability → Policy → Audit

8. Interpretation and limitations

- Controlled synthetic demonstrator assessment.
- Recommendation is advisory only.
- Final transaction authority remains with the participating institution.

Demonstrator boundary. Generated from synthetic/controlled demonstrator evidence. TRUST provides an advisory assessment and policy recommendation; the participating institution retains final transaction decision authority. This document is not production certification.
